

Part I

- 1) Shyp, as a product, applies to virtualization and simplification. Shyp helped virtualize shipping by creating an online program to connect users to shipping groups automatically. It is a simplification through its ability it has to connect shipping groups with users automatically, without the user searching for them, alongside the ability to ship from anywhere in the world, with pickup being decided by the user instead of having to go to a post office to ship their product.
- 2) Curofy is more closely related to Remix and Virtualize. It is remixing the idea of LinkedIn and other professional networking social sites, specifically remixing it for the use of doctors and healthcare workers. It is also a virtualization of communication between doctors about work and safely sharing information and collaborate, respecting their oaths.
- 3) I am looking at PortAura <https://www.producthunt.com/products/portaura> . PortAura is a company that wants to help users understand what is happening on their Macs, helping people see what is happening on their systems and see what ports are being used, and what has changed compared to what they trust the programs to be listening on. PortAura is primarily a simplification by creating a service that negates the need to traverse the command line on Macs to see what is happening on each port and note it down. It will keep you updated with a stream of information, greatly streamlining the process. This app is primarily a painkiller addressing a specific problem that impacts developers, IT, and users worried about security, helping take the difficulty and time out of monitoring ports, making it easier for them to get the information as they want it. There is a possibility for monetization either with more advanced options, like setting a baseline behind a subscription service or making the entire app a subscription, similar to how people pay to download videos when there is a way to do it through the command line. The idea is relatively simple to explain to IT professionals and to discuss with others, but it becomes more complex when dealing with people who are not accustomed to what a port is or how networks work. The idea is not personally relevant to me, as I am not a Mac user, but it is relevant to my interest in technology and networking. The ideas market is very focused and more specialized as a tool for developers and users who are interested in security compared to most users who don't even think about ports or how they connect to a network. The secret sauce PortAura has is in its baseline and scanning for what goes beyond that, as opposed to just being a tool that simplifies viewing activity on each port in a single place, giving it more than just a simple tool but a warning system for when your security is breached by an application that should not be doing that.

Part II

Part A Brainstorming

List of problems & ideas (solutions in subsections):

- ☐ Finding places to camp and nearby hiking trails and the environment
 - ☐ Finding and booking camping spots (focus on tent and temporary/weekend)
 - ☐ All trails combined with either social media or a rewards system (badges for completed trails)
 - ☐ Site for environmental protection awareness
- ☐ Activities to do when you have free time or little free time, leisure

- ☐ Exploration and event app gives people activities when they do not have an idea of what to do and helps find new things to try
- ☐ Music finding app finds trends between artists and connects them, or songs people like to find more in a genre or subgenre that they enjoy
- ☐ Exploration and event app gives people activities when they do not have an idea of what to do and helps find new things to try
- ☐ Local event finder
- ☐ Budgeting for fun and non-essentials
 - ☐ Budget balancing app focused on monthly subscriptions and tracking outcomes from takeout/unessentials (use budget after rent/essentials)
- ☐ Pets' schedule not lining up with yours
 - ☐ Pet care tracker tracks when they need to be groomed, daily tasks such as being fed, walked, etc

Product Proposal – Pet Care Tracker

1- The application I decided to go with is the Pet Care Tracker, a website designed to help pet owners manage their pets' daily routines and essential care needs. Users can create individual pet profiles and log needed tasks, adding them to a calendar either hourly or as calendar events to help track and manage feeding, walking, grooming, medication, vet visits, and other responsibilities.

2- The core idea stems from the challenge of maintaining a busy schedule while also keeping proper care of your pets and ensuring they stay well. This website will aim to help owners stay organized despite their commitments.

3- The product will address and solve the issue of possible pet neglect due to a busy schedule by creating a shared calendar or events to allow multiple household members to properly take care of a pet; it is also great for teaching kids pet responsibility and scheduling with their pets.

4- The product/project is personally meaningful to me due to the pets I have at home in both my parents' households that require attention on different schedules depending on which house I am at, helping create an easy way to keep the dogs on a schedule. An organized system could ease balancing responsibilities, especially in families where different members handle pet tasks.

5- I would say it is primarily a painkiller, as it addresses the issue of forgetting pet responsibilities and helps prevent problems for pets by ensuring they receive proper care. This website can also be a vitamin, as it can reduce stress associated with pets not receiving proper care from your kids or from a dog sitter added to the account, helping ensure they are always properly taken care of.

6- Monetization could be difficult with an app focused on scheduling; a good option could be simple banner ads, not too intrusive to disrupt users and turn them off the website, but making the page busy enough that buying premium for ad-free and possibly a pet subscription that allows for a more integrated webpage with more details or connection with a veterinarian,

7- The product is easy to describe: "A pet-care app that reminds you of your pet's needs and helps your household stay organized." Its simplicity relies on familiar concepts like calendars and reminders, tailored specifically for pet care.

8-Target users encompass pet owners with busy or shared responsibilities, including dog and cat owners, families with multiple pets, students, workers with long hours, travelers, pet sitters, and dog walkers. Due to high pet ownership and ongoing pet care needs, the market potential extends well beyond just cats and dogs.

9- The "Secret Sauce" of this website would be the use of multiple schedules, all in one place for easy pet management, with labeled alarms and alerts set in advance. The main use of this and the real reason to use it is the collaborative schedule.
