

Pet Care tracker

By Ryan Johnson

The Problem

- Many families in america have pets that they want to ensure they are doing the best for, but how sure can we be that our pets are getting the best possible care.
- Over half of pets in the united states exceed the healthy weight standard for pets.
- With over 90% of people saying they treat dogs as members of the family why are they not looking out for their pets health.
- Kids need to learn responsibility for pets.

Solution

- By creating a simple way to get alerts and track pets health and wellbeing alongside their daily routines there are many uses for the site to help give balance to people and pets lifestyle harmonizing them to ensure pet health and that they are responsibly taken care of.
- Schedule appointments through the system and track dogs eating habits for the pets to be able to see that proper measures are being taken for pet health
- Keep updated with dogs medicine on a daily schedule alongside basic pet routines shared with the whole household from walking to feeding.

Business centered website

- The website will be business centered with the scheduling embedded into the site alongside the connection with vets will be a monetized feature for the users.
- The site will help track the routines being done by other members of the household or just yourself with the pets
- This is the best for the product due to either following a free model where unlimited users are allowed and using non intrusive ads to help generate revenue to keep the site running (closer to a non profit) or charged tiers where paying for extra features such as connecting a veterinarian to your account or dog sitters.

Software Development Process

Agile Development

- Following agile development for continued testing of website features as they are added and redesigning rather than trying to complete each step sequentially like a waterfall going back on other parts of the website as needed and following that development cycle again
- Breaking it up into small and testable chunks back into development will help me complete this webpage alongside it allowing me to work on single features at once ensuring they are good enough until I move onto the next doubling back as needed unlike waterfall which follows a sequential rigid process.

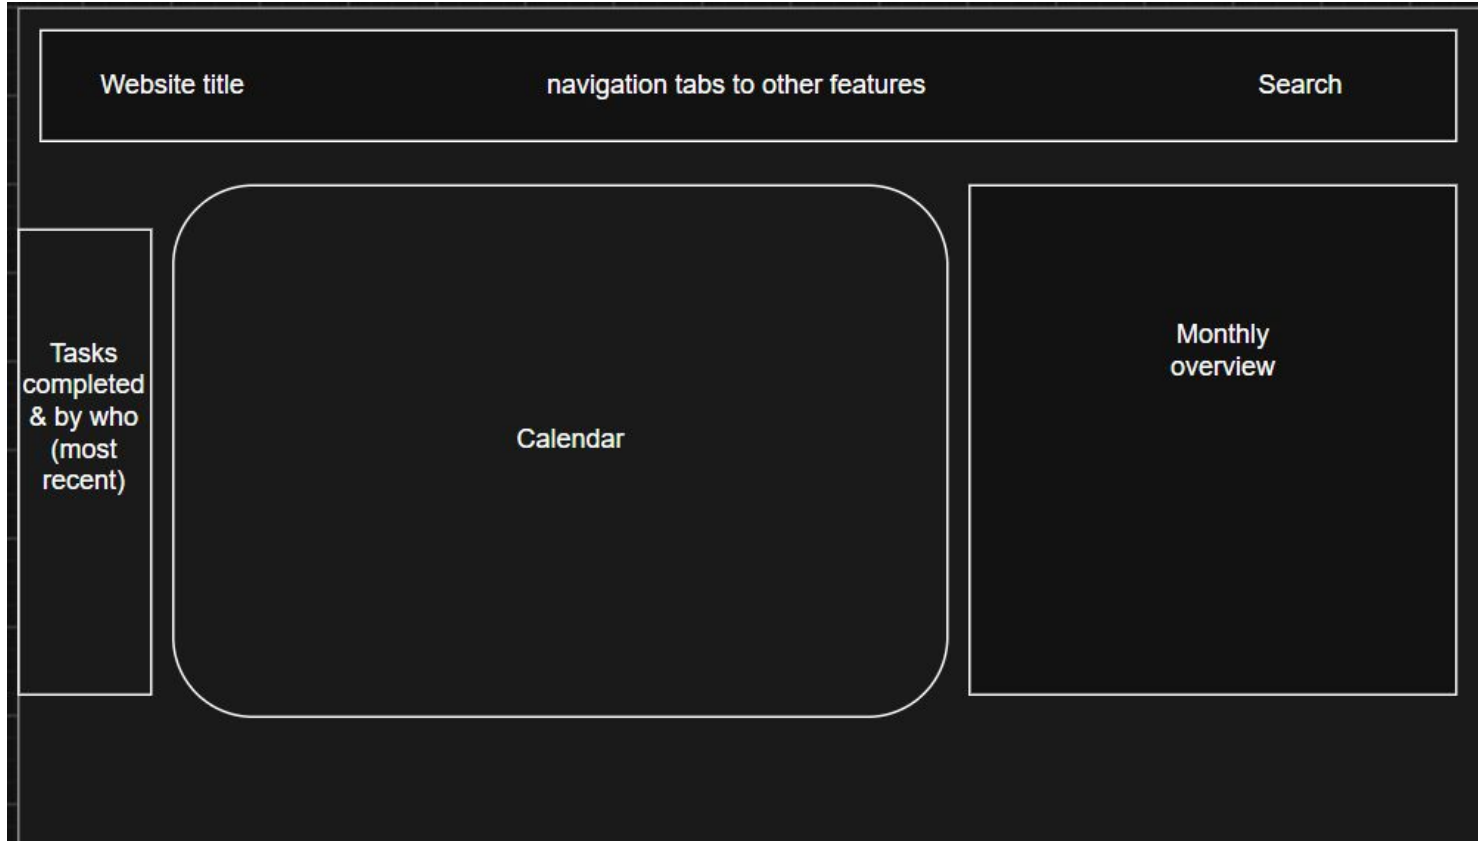

Target Audience

- All pet owners
 - Families as a group
 - Roommates who share pets
 - Busy workers who want to have a system for them and the dog sitter to check in on making sure the pet is receiving the care it deserves.

Key Content & Features

- Calendar scheduling which then can collapse into a single day schedule so habits can be seen and see different times when dogs were fed or walked (as simple as checking them off a checklist and time taken)
- Veterinary connection for them to be either attached to a family or a service to help find useful ones near you by google ratings
- Family/Household tab will help see who is doing what task and ensuring everyone is doing their role in helping their extra family member.

Pitch Summary

The product is needed for busy people and families to keep up with the habits of their pets and making sure everyone is doing their part in taking care of them.

Feedback Questions

- Is the product helpful?
- How will this help pets health?
- Is the calendar not helpful due to phones having their own calendar systems.
